

# Retrospective report

*Add your notes below, use bullet points where useful.*

## **User Story Status**

- All must-have and should-have user stories have been completed.
- One could-have user story has not been started, this can be saved for future updates to the website.

## **What has been achieved**

- A working MVP speed typing test.
- Met almost all of our initial user stories.
- Coding out was accelerated with the use of Copilot

## **Areas for improvement**

- The accuracy feedback and calculations can be broken by adding extra spaces into the textarea.
- The end test functionality does not work on a mobile device because mobiles and tablets do not register keydown events, additional code would be needed to implement this functionality on mobile.

## **Lessons learned**

- Clear and specific prompts for Copilot yield better results than vague or general requests. By clearly outlining my goals, context, and expectations, I can achieve more accurate and effective outcomes.
- When implementing the start and stop functionality, it would have saved time to consider if buttons were the best implementation at the User Story level, this would have avoided making fixes to existing code later on.
